

Increase in business efficiency through automatic collection of production information and view its activities in Real-time.

This customer needs to install new monitoring system due to the lack of efficiency in their existing system to collect production information and also to meet customer’s demand about delivery schedules. In this new system, WebFINDER, a software product enable the collection system to automatically creates all activities in a database. Production information such as raw material quantity, production volume, stock inventory and delivery information are reported in a real-time view which are collected automatically by ADDO F2008,a hardware device. This new monitoring system started operation in December 2005.

<Person who is in charge of production control>

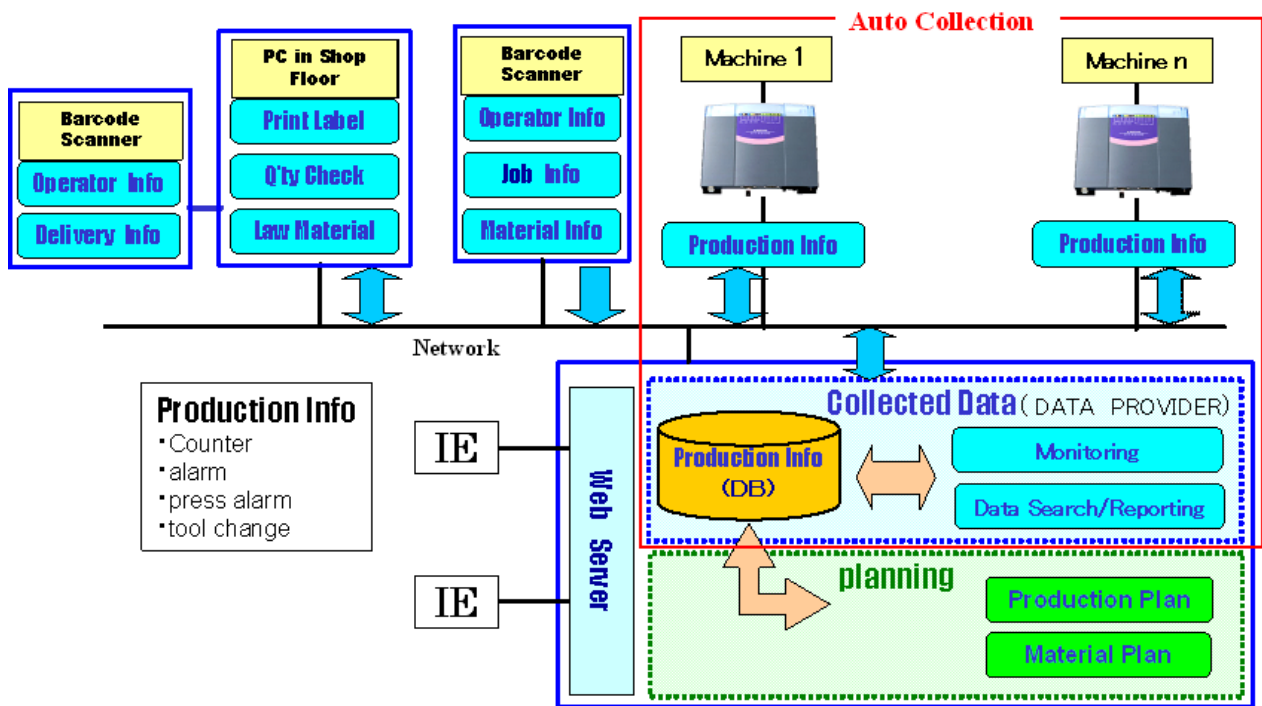

“I need to make many sub management reports using Excel due to lack of data collected from the old production control system. With the new system, I’m now able to get real-time production information and reports such as volume, inventory etc...”

<Person who is in charge of accounting>

“I’m now able to accurately and timely obtained all the necessary information for cost calculation”

System Outline:

Production information is collected automatically for management.

- ① Production Management
- ② Daily Report Management

- Process Report is available with reference to its operation order number.
- Progress Report is available with reference to its production process.
- Total management of data for each order number are recorded in a server.
- Cost calculation are based on production information collected.
