

Email Communication upon Alarm and Production Completion in an Unmanned Operation.

This customer needs long hours of production time for producing very precise molds and dies including very small one. Unmanned operations in the evening have to be scheduled frequently. The person responsible for this operation has other responsibilities in another factory. With F2008, he can act immediately to reduce machine down time since he is able to automatically get email upon alarm condition and upon production completion.

<Operator>

I normally visited factory at estimated production completion time but there were lots of time wasted. With F2008, I can act immediately when I get email.

<Shop Floor Manager>

We are very satisfied with the increase in efficiency of machine utilization. We are planning to install more F2008 on other machines as soon as

System Outline:

Increase efficiency by remote monitoring of equipment.
